

Using Dual Monitors

DID YOU KNOW . . . that using two or more monitors lets you get more work done, more quickly?

What Dual Monitors Give You

- Increase display space for increased productivity
- Keep all the windows you need for your job “on top”
- Stretch very large view windows across both monitors
- Multitask: TNT products on one monitor -- Web, Email, or document processing on another
- Stop wasting time searching for windows that are hidden below others

How Dual Monitors Work

- Install one dual-monitor display card or two single-monitor cards.
- Configure your operating system to recognize both monitors: their color depth, resolution, and relative positions.
- MI/X on one monitor:
By default, the MI/X window fills your primary display and you can drag it between the monitors.
- MI/X on both monitors:
To spread MI/X across both monitors, turn on multiple monitor support with Support / Setup / Preferences. Then Select the MI/X panel in the General System Preferences dialog and click the Use Multiple Monitors toggle.

DUAL MONITORS
